Week 7

- CONVERGING: TAKING VALUE OF OUR RESEARCH - INSIGHTS E HMW

Design Thinking Projects – The problem

How can we encourage youth (aged 14 - 18) to participate and intervene in urban mobility solutions?

building innovation + value for businesses and people

CONVERGING: TAKING VALUE OF OUR RESEARCH

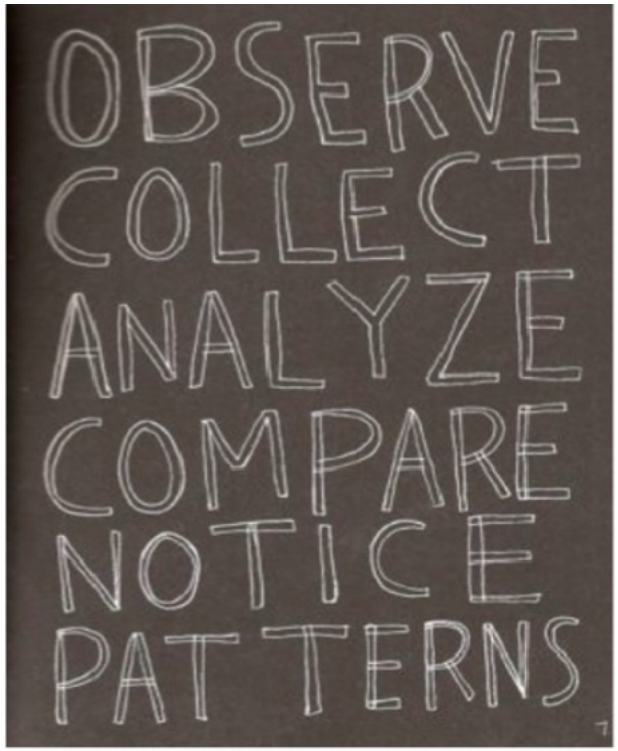

- Unpacking all the information
- What you’ve seen, gathered and observed
- Share all stories in detail

TIME
COLLABORATION
ACCOUNTABILITY
RESOURCES
FEEDBACK ORGANIZATION
Look for patterns, contradictions and situations that are not obvious

Analyze and organize the information

Observation

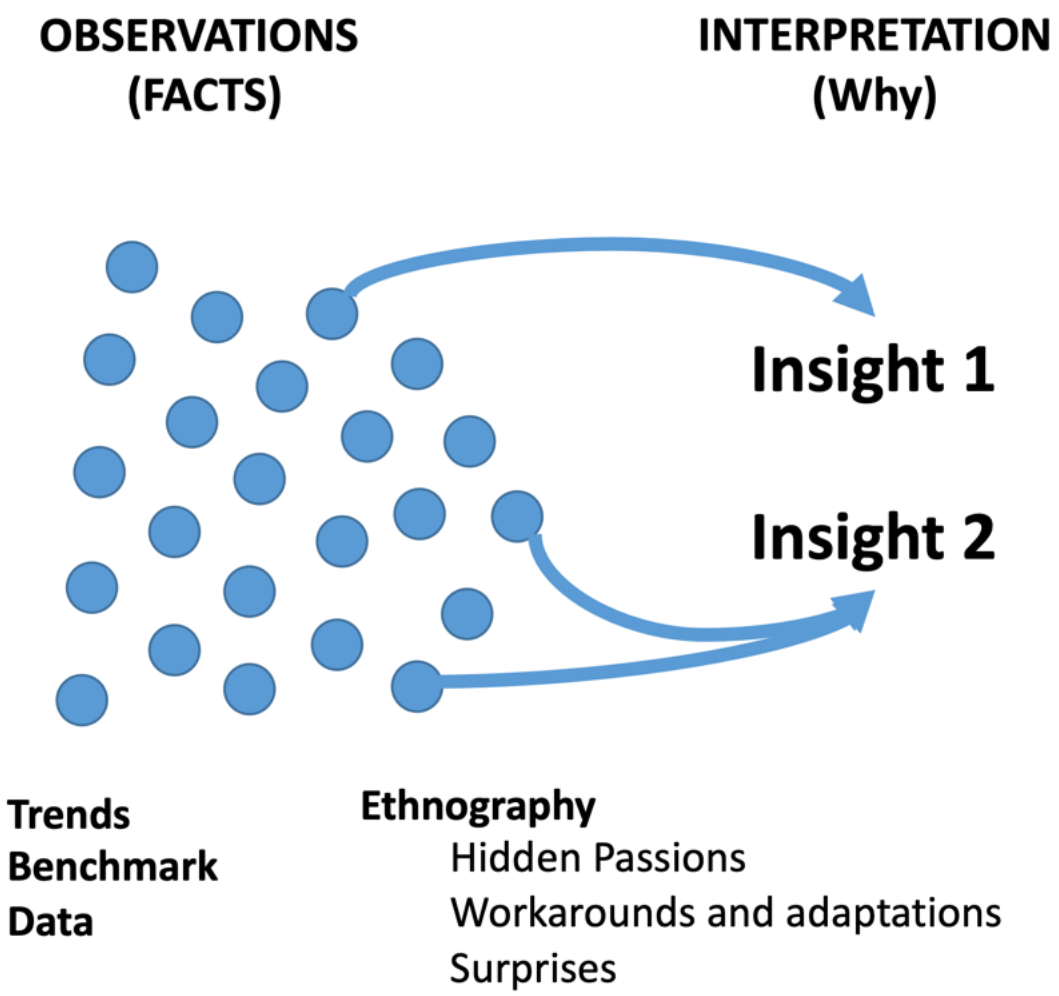

The Facts

Insights

The Why?

Through synthesising user stories, we will identify key insights that offer a human rather than technological or business lens to tackle the challenge at hand.

INSIGHT GENERATIO N

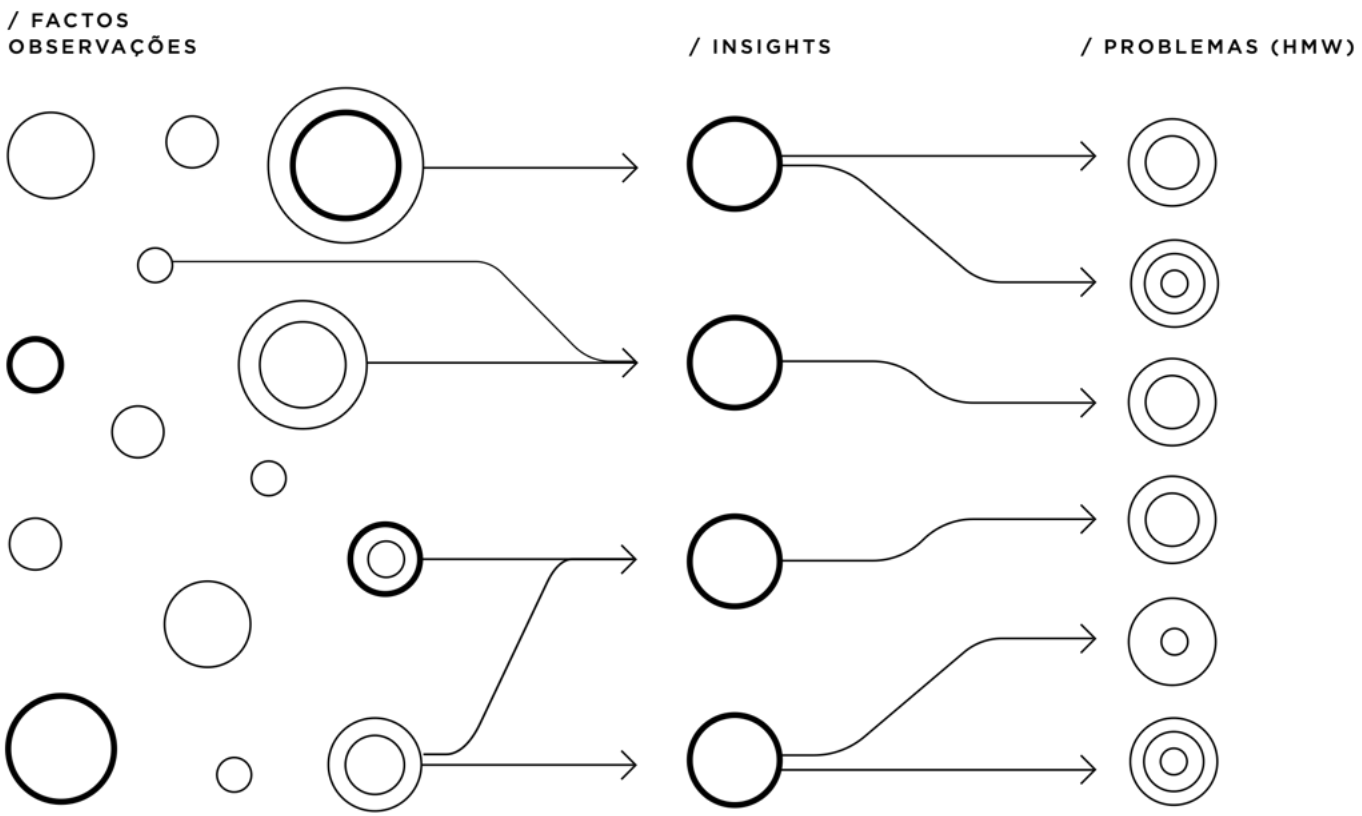

Figura 7. Factos, insights e HMW

Insights Can Be a Collaborative Pursuit of Understanding

Jane Fulton Suri
IDEO Partner Emeritus & Executive Design Director

- *User insights are the golden nuggets that allow us to understand the needs, motivations, and aspirations driving the people we design for.*

Insight Generation Principles

- *Exploration for insight can be an individual pursuit, but is usually more useful in collaboration with others.*
- *What seems obvious to you may feel like an amazing insight and fresh thinking for someone else, and vice versa.*

Insight Generation Principles

- *Design insight is a social affair because you'll want to reach a shared perspective about what matters currently and what will matter for people in places and with things in the future. And that process of sharing and discovering new things together is refreshing, motivational, and a great boost to team energy and effectiveness.*

Insight Generation Principles

- *Insights often reveal a hidden truth, which is one of the reasons they can be so valuable.*

Insight definition

An unrecognized fundamental human truth that reveals the inner nature of things

A new way of viewing the world that causes us to reexamine existing conventions and challenge the status quo

Insight definition

A penetrating observation about human behavior that results in seeing consumers from a fresh perspective.

A discovery about the underlying motivations that drive people's actions.

What an Insight is Not

INSIGHT IS NOT DATA

AN OBSERVATION IS NOT AN INSIGHT

A CUSTOMER WISH OR STATEMENT OF NEED IS NOT AN INSIGHT

AN INSIGHT IS NOT

AN OBSERVATION

Observations are an incredibly important part of creating insights but are still only one data point to consider and should never stand alone.

Facts lack the "why" and the "motivation" behind a consumer's behaviour.

A USER'S WISH

Articulating user's needs is perfect for identifying new features and incremental changes, but do not result in insights which have the power to overwhelm existing solutions and generate new ones.

Insights are less apparent, intangible, latent.

A SOLUTION

Sometimes, there is a tendency to jump immediately to solutions or to formulate insights in a mission statements format.

The most powerful insights come from rigor and serious analysis to translate large amounts of data into concise and compelling findings

AN INSIGHT IS

AUTHENTIC

Based on observations

NON OBVIOUS

Something that is latent and less aparent

REVEALING

the “why” and the “motivation” behind a behaviour

context
CONTEXT
Set the Context
DILEMMA
Communicate the Dilemma
WHY
Articulate the Why
MOTIVATION
Capture the Motivation
INSIGHT
IDEAL
Envision the Ideal

HOW DO YOU KNOW WHEN YOU HAVE A SIGNIFICANT INSIGHT?

– It connects with consumers on an emotional level and elicits the reaction “you obviously understand me.”

– It re-examines existing conventions and challenges the status quo.

– It solves a real problem that results in the creation of new customers.

– It inspires action by giving you a clear target to aim for.

– It is a clear statement of what do next and how to deliver value to your customers.

INSIGHT GENERATION

Tell us a story about your observations

Let's Try to Generate an Insight

(group work)

(impact on where to work based on group relations)

DEFINE

- The “Define” stage involves collating all the data from the “Empathize” stage in order to drill down to the exact problem that NEEDS to be solved (Mark the word problem, not solution)

Goals:

- To develop a deep understanding of the users & the design space and come up with an individual statement or point of view
- To craft a meaningful and actionable problem statement, ensuring we are solving the right problem
- Point of view should be guiding statement that focuses on specific users, insights and needs
- Understanding the meaningful challenge/problem is fundamental to building a successful solution

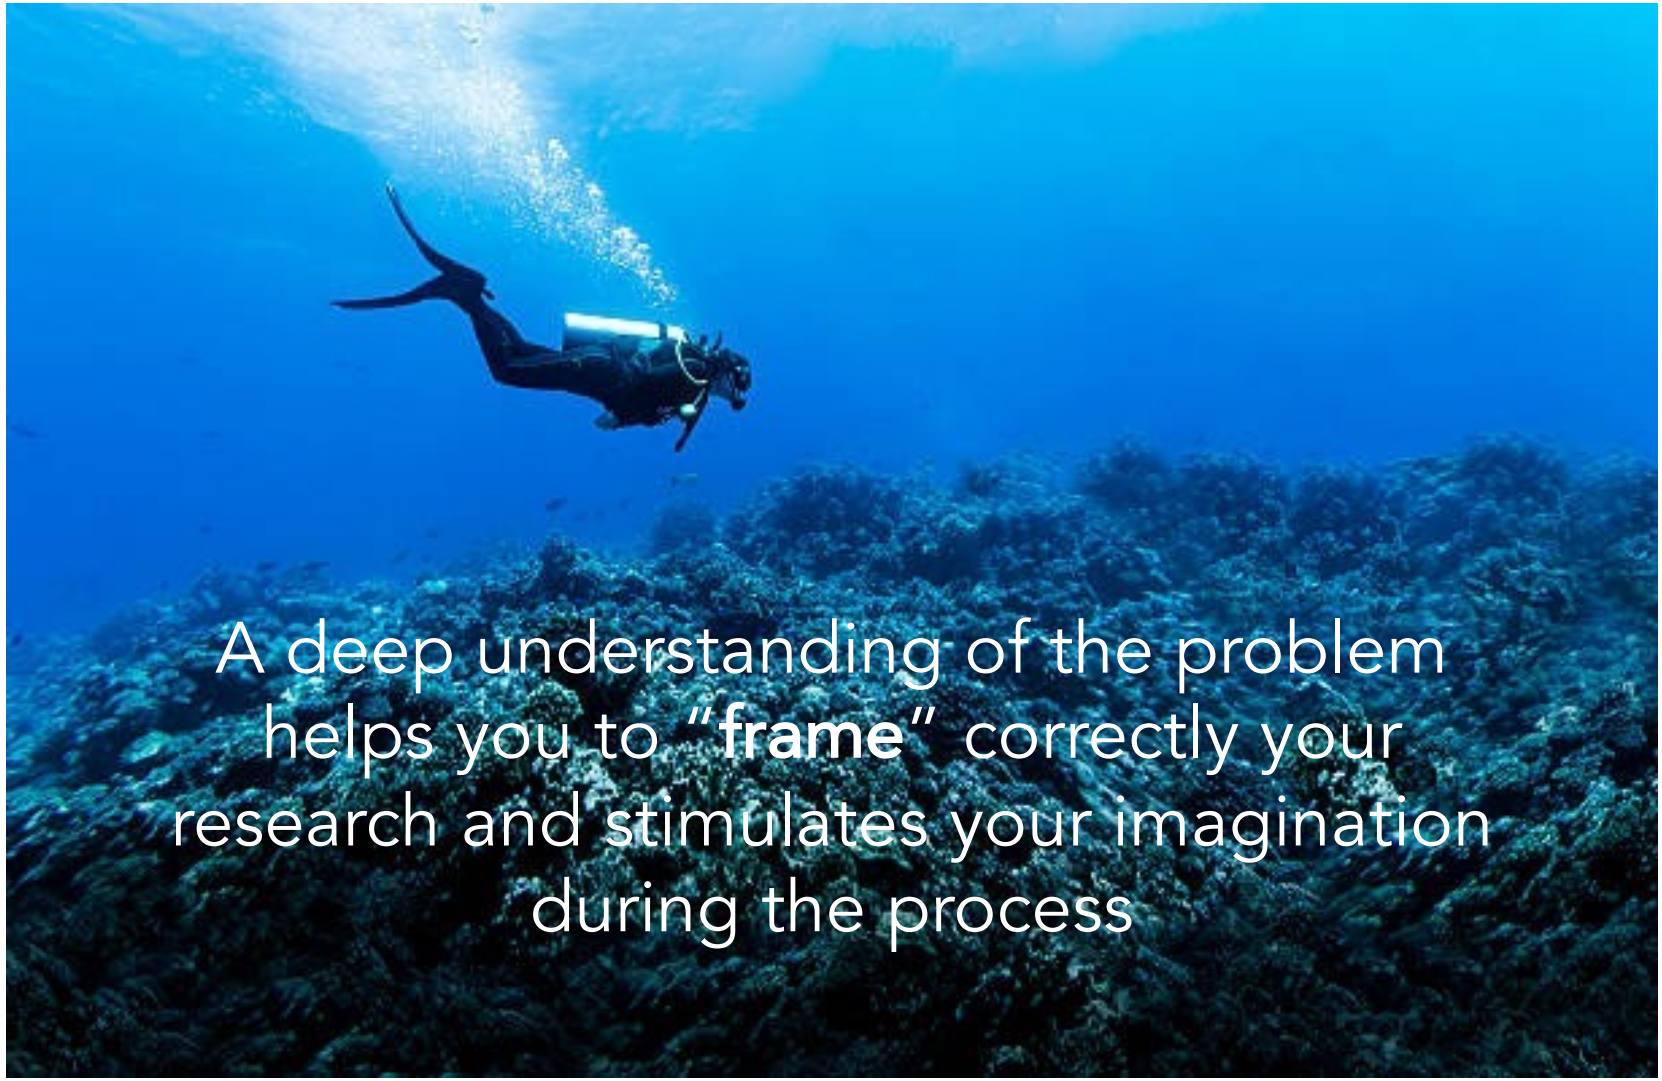

UNDERSTAND

A well defined problem is a

of a solved problem

UNDERSTAND

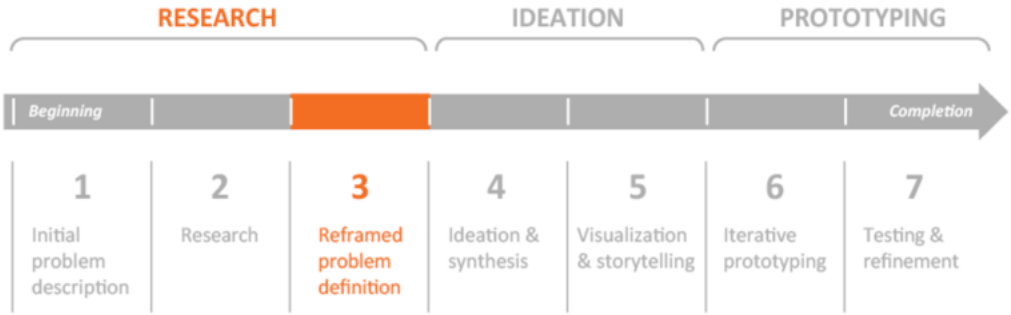

A deep understanding of the problem
helps you to "**frame**" correctly your
research and stimulates your imagination
during the process

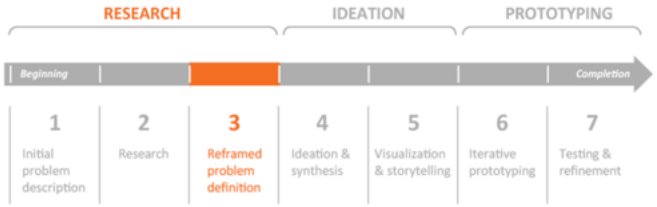

USING RESEARCH TO REFRAME THE PROBLEM DEFINITION

- Robust user research and a strong analysis of the data are critical for refining and clarifying your understanding of the user problem.
- This new understanding of the problem is based on your empathetic understanding of the users' problem. You will use the story that emerges from your research to communicate your new understanding of the problem to stakeholders, help the team focus its work in upcoming design thinking stages, and use it to check against proposed solutions.
- This is the point where you will reframe your initial problem description into a more clear and detailed problem definition.

What are the aspects of a solid reframed problem definition?

- Provides clear and concise descriptions of deficiencies, inefficiencies, or lack of responsiveness to needs in the current situation
- Identifies the individual or entity most likely to benefit from a strong solution
- Describes why the problem matters to users
- Describes why previous solutions to the problem did not succeed

What are the aspects of a solid reframed problem definition?

- Indicates the advantages of the new potential solution(s)
- States the most promising opportunities and potential risks
- Throughout the rest of the design thinking process, you will come back to the reframed problem definition to select which ideas and potential solutions are more or less likely to be successful based on your current understanding of the user research.

Problem Statements

- They are created based on a deeper understanding of your specific users, their needs and your most essential insights about them.
- A good Problem Statement will allow you to ideate and solve your design challenge in a goal-oriented manner in which you keep a focus on your users, their needs and your insights about them.
- Your Problem statement should never contain any specific solution, nor should it contain any indication as to how to fulfill your users' needs in the service, experience, or product you're designing. Instead,
- Your Problem statement should provide a wide enough scope for you and your team to start thinking about solutions which go beyond status quo

Creating Problem Statements

From the point of view of the user

- **I am** (persona) **trying to** (verb) **but** (barrier) **because** (cause) **which makes me feel** (emotional reaction)
- **Example:** *"I am a new mum trying to take care of my baby in the best way possible, but I don't know if I'm doing a good job because I'm always at home alone and don't have anyone to talk to about it, which makes me feel isolated and alone"*

Drawn from user research

- (Persona) **needs a way to** (user's need) **because** (insight)

Example: *A new mum needs a way to connect with other mums because they are often at home alone during the day and feel isolated and alone.*

Using the 4 Ws

- **How might we help** (who) **who has/have** (the problem I.E what) **when** (where)? **Our solution should deliver (why)**
- *How might we help a new mum who has no one to talk to about the best way to care for her baby when she is at home alone every day. Our solution should deliver a way for her to feel connected to other mums so she feels less isolated and alone.*

Point of View

- **DEFINE**

- Define the type of person you are designing for – your user.
- Ex: define the user by developing one or more personas
- Select the most essential needs, which are the most important to fulfil. Extract and synthesise the needs you've found in your observations, research, fieldwork, and interviews. Remember that needs should be verbs.
- Work to express the insights developed through the synthesis of your gathered information.

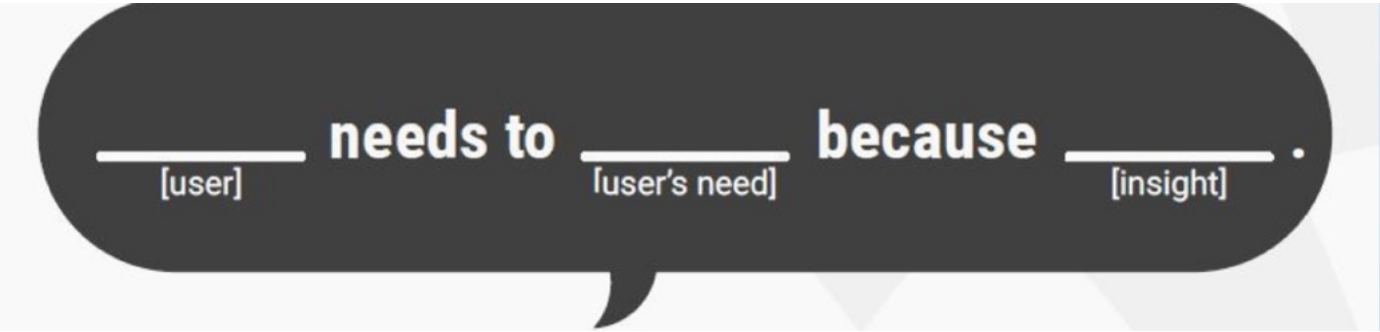

Point of View Template – Example

User	Need	Insight
An adult person who lives in a city	To use a car for 10-60 minute trips 1-4 times per week	The user would not want to own his own car as it would be too expensive compared to his needs. He would like to share a car with others who have similar needs, however, there are no easy and affordable solutions for him. It's important for the user to think and live green and to not own more than he truly needs.

Point of View

Combine these three elements – user, need, and insight – as an actionable problem statement that will drive the rest of your design work using the following template.
[User . . . (descriptive)] needs [Need . . . (verb)] because [Insight . . . (compelling)]

Example: An adult person who lives in the city… needs access to a shared car 1-4 times for 10-60 minutes per week … because he would rather share a car with more people as this is cheaper, more environmental friendly, however it should still be easy for more people to share.

Creating Problem Statements

- Define the type of person you are designing for – your user.

For example, you could define the user by developing one or more personas, which help you to understand and crystallise your research results – observations, interviews, fieldwork, etc.

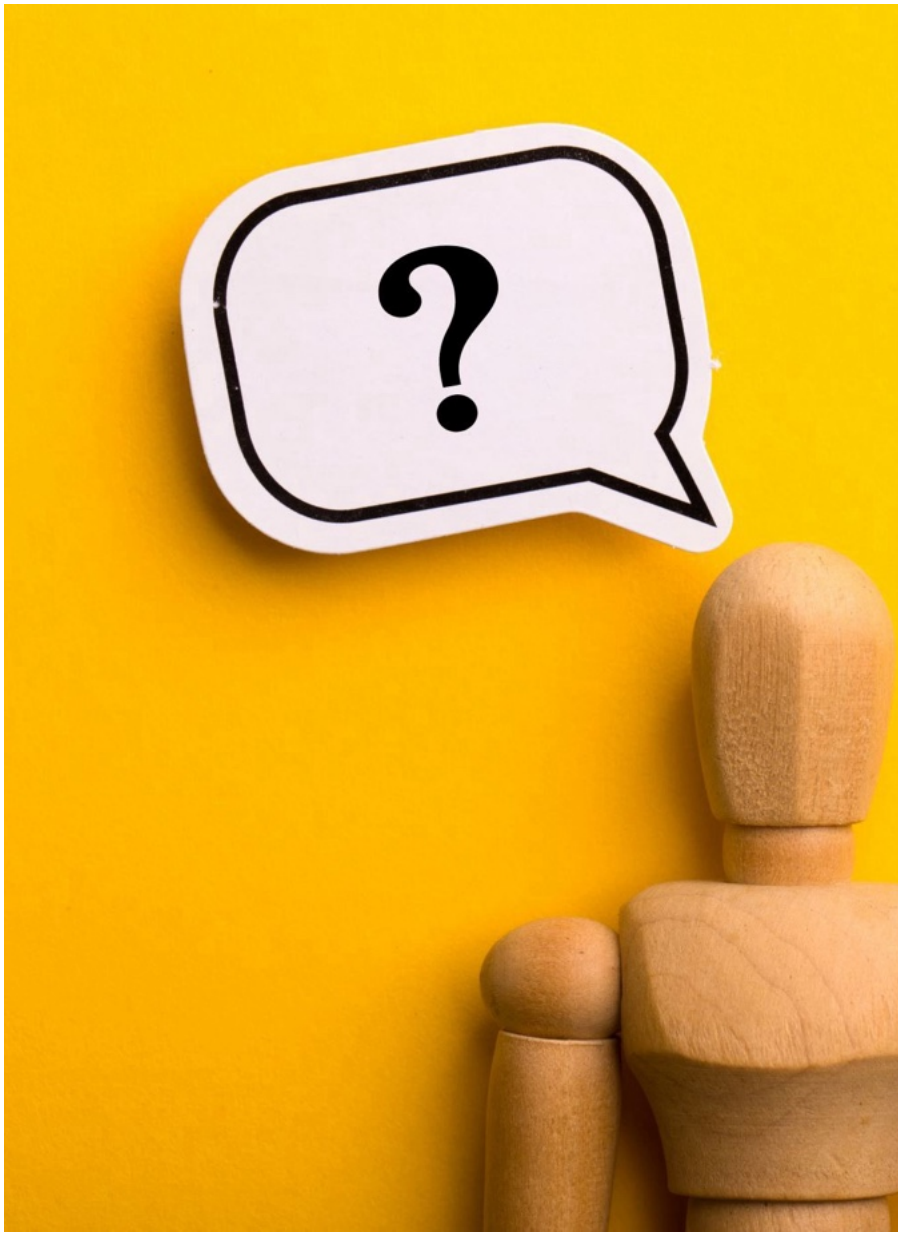

- Select the most essential needs, which are the most important to fulfill. Again, extract and synthesise the needs you've found in your observations, research, fieldwork, and interviews. Remember that needs should be verbs.
- It must be user-centred

It should be about the people/person you are trying to solve the problem for and not the technology or tool to be used
It must be broad enough to allow creative freedom
It should not focus on a specific implementation approach
It must be Narrow enough to make it manageable.

- Forward Looking: A good problem statement must contain seed of possibilities
- Make your statement Action Oriented

Creating Problem Statements using the 4 W's (How Might We)

- Who: Who is affected? Who is experiencing the problem? Can this user be further specified (by demographic, persona, motivations etc)
- What: What are the struggles? What tasks needs to be accomplished? What pain points needs to be relieved?
- Where: What is the context in which the user experiences what was discussed in the “What”? What pain points needs to be relieved? Where does the pain occur?
- Why: Why is this problem worth solving? What value does it bring to the user? What value does it bring to the business ?

HMW’s - How Might We

Every problem is an opportunity for design.
By framing your challenge as a How Might We question, you’ll set yourself up for an innovative solution.

How Might We

"How" suggests that we do not yet have the answer.

"How" helps us set aside prescriptive briefs. "How" helps us explore a variety of endeavours instead of merely executing on what we "think" the solution should be.

"Might" emphasises that our responses may only be possible solutions, not the *only* solution.

"Might" also allows for exploration of multiple possible solutions, not settling for the first that comes to mind.

"We" immediately brings in the element of a collaborative effort.

"We" suggests that the idea for the solution lies in our collective teamwork.

Creating Problem Statements using the 4W's (How Might We)

The "How Might We" method is constructed in such a way that it opens the field for new ideas, admits that we do not currently know the answer, and encourages a collaborative approach to solving it.

By framing your challenge as a How Might We question, you'll prepare yourself for an innovative solution in the third Design Thinking phase, the Ideation phase.

Begin with your problem. Rephrase by asking "how might we" at the beginning

Break the problem into smaller actionable & meaningful questions

Brainstorm the questions before the solution

If your questions are too broad, narrow down; and vice versa

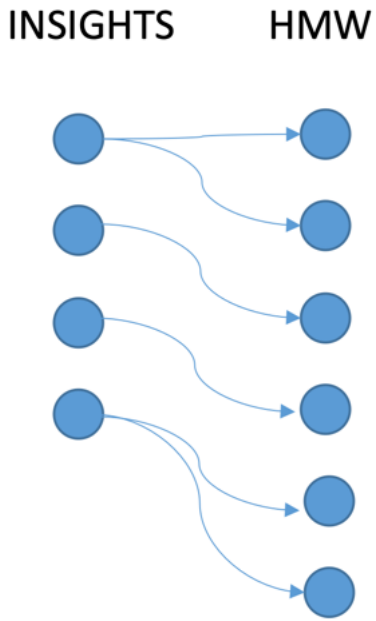

How Might We

- When you've re-defined your design challenge, you can start by asking a specific question starting with, "How-Might-We?" or "in-what-ways-might-we?".
- For example, if your problem is: "Teenage girls need… to eat nutritious food… in order to thrive and grow in a healthy way."

- How Might We make healthy eating appealing to young females?
- How Might We inspire teenage girls towards healthier eating options?
- How Might We make healthy eating something, which teenage girls aspire towards?
- How Might We make nutritious food more affordable?

HOW MIGHT WE

- Start by looking at the insight statements that you've created.
- What further insights/topics arise from the design challenge? These topics are subsets of the entire problem. They focus on different aspects of the challenge.
- Try rephrasing/reframing them as questions by adding "How might we" at the beginning.
- The goal is to find opportunities for design, so if your insights suggest several How Might We questions, that's great!

How Might We

Help companies make everyday work more fun and engaging for millennials?

INSIGHT

Millennials want their lives to be an exciting adventure, even if that excitement comes in small bits in their everyday lives

"Homemade white Pepper at work! Such a pleasure!"

"Always learning something new in my Design Class. Whew!"

Design Challenge

How might we help millennials fulfil their potential in a creative and meaningful way
